perience "pop-on", lights cannot be tially off. Then, the slider can be lov I Rating	turned on immediately to their minimur rered to get to a lower light level; the dir	n level. The slider needs to be raised above the	minimum light level for the I level.				

One or more of the following observed: Minor flickering at some point may exist. Dead travel may exist, which means there may be periods of time when the slider (or other form of control button) is moved without affecting the light level. These periods of dead travel are minor and most of the time not visible. Minor audible noise. Most of the following observed: No flickering, minimal audible noise (typically less than 25 dBa), wide dimming range - can dim down to 20% or less of light output. Best High End (H.E.) Dead Travel Low End (L.E.) Dead Travel Determines how much, if any, dead travel exists at the top and bottom of the dimmer's range. Dead travel is when the slider can be moved without affecting the light level.
